Negative

Interpretation

1) A Negative result implies that no Anti HIV-1 or HIV-2 antibodies have been detected in the sample by this method. This means that either the patient has not been exposed to HIV-1 or HIV-2 infection or the sample has been taken during the "WINDOW PERIOD" (before the development of detectable levels of antibodies).

2) Positive result suggests the possibility of HIV-1 or HIV-2 infection.

Advise:

To rule out false positivity, false negativity and window period, kindly perform "Confirmatory Tests" like HIV I RNA (Qualitative) Real Time PCR.

Kindly correlate with clinical findings
